M2 end-to-end class pair (message-zero vs message-ones): NOT distinguishable at this budget — localization-layer note

LOCALIZATION LAYER (separate evidence, NOT a wall-clock measurement): the unfixed chain has 1 `div` in each of 3 hotspots and the fixed chain has 0; KyberSlash varlat reports 1280 errors / 3 contexts (unfixed) and 0 / 0 (fixed). See m2-kem-20261016/RESULT.md. THIS FIGURE SHOWS NO END-TO-END DIFFERENCE.

The unfixed and fixed arms are two DIFFERENT BUILDS with different absolute levels (about 56.8 us vs about 60.8 us). That offset is a build difference, not the tested effect, so the two arms are never placed on a common axis here. This figure must NOT be read as 'the fix changed the timing'.
